Device thermal performances

All the figures given in this section are obtained assuming that the QFN device is cooled down only by conduction through the package thermal pad (no convection mode considered). The temperature is monitored at the package back-side interface (Tcase) as shown below. The system maximum temperature must be adjusted in order to guarantee that Tcase remains below than the maximum value specified in the next table. So, the system PCB must be designed to comply with this requirement.

A derating must be applied on the dissipated power if the Tcase temperature can not be maintained below than the maximum temperature specified (see the curve P_{diss. Max}) in order to guarantee the nominal device life time (MTTF).

DEVICE THERMAL SPECIFICATION : CHA5115-QDG		
Recommended max. junction temperature (T _{j max})	:	155 °C
Junction temperature absolute maximum rating	:	175 °C
Max. continuous dissipated power @ Tcase= 85 °C	:	1.52 W
=> P _{diss} derating above Tcase ⁽¹⁾ = 85 °C	:	22 mW/°C
Junction-Case thermal resistance (R _{th J-C}) ⁽²⁾	:	<46 °C/W
Min. package back side operating temperature ⁽³⁾	:	-40 °C
Max. package back side operating temperature ⁽³⁾	:	85 °C
Min. storage temperature	:	-55 °C
Max. storage temperature	:	150 °C

(1) Derating at junction temperature constant = T_{j max}

(2) R_{th J-C} is calculated for a worst case where the **hottest junction** of the MMIC is considered.

(3) Tcase=Package back side temperature measured under the die-attach-pad (see the drawing below).

- Using a micro-strip to coplanar transition to access the package.
- Recommended for the implementation of this product on a module board.
- Decoupling capacitors of 100pF $\pm 5\%$ on drains; and 10nF $\pm 10\%$ and 1 μ F $\pm 10\%$ on gate are recommended for all DC accesses.
- When using CW mode, decoupling capacitors of 10nF $\pm 10\%$ on drains are recommended.
- See application note AN0017 for details.
