

14W Power Transistor

GaN HEMT on SiC

Description

The CHK8013-99F is a 14W Gallium Nitride High Electron Mobility Transistor.

This product offers a general purpose and broadband solution for a variety of RF power applications such as radar and telecommunication.

The circuit is manufactured on a 0.25µm gate length GaN HEMT technology on SiC substrate.

It is proposed in a bare die form and requires an external matching circuitry.

Main Features

- Wide band capability up to 10GHz
- Pulsed and CW operating modes
- GaN technology: High Pout & High PAE
- DC bias: V_D up to 30V
- Chip size: 0.9x1.2x0.1mm
- RoHS N°2011/65
- REACH N°1907/2006

Main Electrical Characteristics

$T_b^{(1)} = +25^\circ\text{C}$, pulsed mode, Freq = 6GHz, $V_{DS} = 30\text{V}$, $I_{D_Q} = 0.18\text{A}$

Symbol	Parameter	Min	Typ	Max	Unit
G_{SS}	Small Signal Gain		17		dB
P_{SAT}	Saturated Output Power		14		W
PAE	Max Power Added Efficiency		70		%
G_{PAE_MAX}	Associated Gain at Max PAE		11		dB

⁽¹⁾ Operation of this device above anyone of these parameters may cause permanent damage.

⁽²⁾ Duration < 1s.

⁽³⁾ The given values must not be exceeded at the same time even momentarily for any parameter, since each parameter is independent from each other, otherwise deterioration or destruction of the device may take place.

⁽⁴⁾ Max junction temperature must be considered.

⁽⁵⁾ Linked to and limited by I_{G_max} & I_{G_min} values. Maximum input power depends on frequency and should not exceed 2dB above PAE_{max}.

Biasing procedure

1. Bias power bar gate voltage at V_g close to V_{pinch-off} (Typically: V_{GS} ≈ -5V)
2. Apply V_{DS} bias voltage (Typically: V_{DS} = 30V)
3. Increase V_{GS} up to quiescent bias drain current I_{D_Q}

The quiescent current steady state must be carefully controlled as it is influenced by the operating mode, the temperature and the overall thermal resistance.

A drain current control is recommended on the biasing network.

Device thermal information

The thermal performances of the device are based on UMS rules to evaluate the junction temperature (T_j). This temperature is defined as the peak temperature in the channel area.

This same procedure is the basis for junction temperature evaluation of the samples used to derive the Median lifetime and activation energy for the particular technology on which the CHK8013-99F is fabricated (GaN Power PHEMT 0.25 μ m).

The temperature T_b is defined as the chip back side temperature

The thermal resistance (R_{th}) is given for the full power bar, in CW operating mode and in two different configurations as given in the table. The device assembly must be adapted to the operating mode. Thermal analysis is recommended. More information is available on request.

Parameters	Symbol	Conditions	Value	Unit
Typical Thermal Resistance	R_{th}	Bare die characteristic $T_b = 125^\circ\text{C}$	5.3	$^\circ\text{C/W}$
Junction Temperature	T_j	$P_{diss} = 13.7\text{W}$ CW	200	$^\circ\text{C}$

The back side temperature (T_b) is considered uniform on all the surface

Typical Thermal Resistance	R_{th}	Bare die on carrier characteristic $T_{case} = 85^\circ\text{C}$	8.2	$^\circ\text{C/W}$
Junction Temperature	T_j	$P_{diss} = 14\text{W}$ CW	200	$^\circ\text{C}$

The reference temperature (T_{case}) is defined on the carrier back side. The power bar is mounted on carrier plate (20 μ m Au/Sn soldering + 1.4mm Cu/Mo/Cu).

Median Life Time versus Junction Temperature

Power Bar Description

The device integrates 2x7W elementary cells. These cells are connected together with a specific network providing a good trade-off between performance and stability (resistance between gates and drains as described on the schematic). The reference planes are on the center of the bonding pads.

A multiport non-linear model is available on request.

Elementary Cell Maximum Gain & Stability Characteristics

Tb = +25°C, V_{DS} = +30V, I_{D_Q} = 90mA, simulated results

Elementary Cell Load Pull Performances

Tb = +25°C, V_{DS} = +30V, I_{D_Q} = 90mA, simulated results

The impedances are chosen as a trade-off between Output Power, PAE and Stability of the device. Second harmonic of output load has been tuned.

These values are given in the bonding pads reference plane.

Comparison Simulation/Measurement of Elementary Cell Load Pull Performances

Tb = +25°C, Elementary cell 8x225µm

- Frequency: 3GHz
- Bias point: 30V, 50mA/mm
- ZloadH2 = ZloadH3 = 50Ω
- Zsource matched for maximum gain
- CW on wafer measurement
- Measurement are given in the transistor plan at 5dB of compression

PAE(%), Output Power (dBm) and transducer gain (dB) vs the load impedance

Measurements are represented by multicolour dots and model by black contours.

Mechanical data

Chip thickness: 100 μ m +/- 10 μ m
All dimensions are in micrometers

All Gate and Drain pads must be connected, and backside grounded. Other ground connections are optional (source is grounded through vias hole).

Reference	Pad number	Pad size
DC Gate pads	(2,4)	119x204 μ m ²
DC Drain pads	(7,9)	119x204 μ m ²
GND pads	(1,3,5,6,8,10)	97x95 μ m ²

Notes

Qualification domain

This part is qualified according to UMS standards, excluding humid environment.
